Principle

A standard resistor *Rs* is introduced into the resistance meter as in the circuit diagram.
A common current *Is* flows to both the resistor *Rs* and a specimen *Rx* under test.
Thus, voltage drop generates separately:
IsRs=Es for *Rs*, *IsRx=Ex* for *Rx*.
The measured voltages, *Es* and *Ex* are divided in the dividing circuit.
$Ex / Es = Is\,Rx / Is\,Rs = Rx / Rs$
A ratio of *Rx/Rs* is given digitally.
